Wie verbreitet ist Roboterjournalismus?

- Seit 2014 immer mehr Automatisierung bei Medien
- Derzeit nützen zumindest 9 Nachrichtenagenturen in Europa eine Form der automatisierten Texterstellung
- Anwendungsfelder: Sport und Finanzen
- Im deutschsprachigen Raum bei den Agenturen bisher vor allem Vorstufen im Einsatz - aber immer mehr andere Player steigen ein
- Schlüsselressource: Strukturierte Daten

Expectant mums ignoring risk and lighting up while pregnant

ONE fifth of expectant mothers living in Dover, Deal and the Shepway district - which spans from Folkestone to the Romney Marsh - are smoking while pregnant.

There were 508 pregnancies reported in the second quarter of 2017, and 102 of these mothers (20.3 per cent) smoked throughout their pregnancy.

This is up from the 18.6 per cent of mothers who smoked in the same period of last year, and from the 15.9 per cent of mothers who smoked four years ago.

The NHS wants to reduce the number of mothers who smoke while pregnant to six per cent - but the rate in the south Kent coast NHS commissioning area, which effectively covers most of east Kent, has increased even as numbers have gone down nationally.

The Department of Health has been targeting pregnant smokers due to the risk of serious health complications for both mother and child.

When a woman smokes during pregnancy it restricts the flow of oxygen to the unborn child.

This can lead to complications during labour, increased risk of

Smoking is more common among pregnant women from disadvantaged groups, according to the Department of Health.

It is also known that children who grow up with a smoking parent are more likely to smoke themselves.

The Department of Health is hoping to reduce the number of women smoking while pregnant

1 in 3 primary school children are overweight

Obesity puts them at higher risk of diabetes, cancer, heart and liver disease later in life

Paul Brackley
paul.brackley@iffimedia.co.uk

One in three children leaving primary school in Cambridge is unhealthily overweight, shocking new figures have revealed.

The statistics have prompted warnings about an obesity timebomb – as obese children are five times more likely to become obese adults, increasing their risk of diseases such as type 2 diabetes, cancer, heart and liver disease.

The data, from Public Health England's National Child Measurement Programme, shows that 16 per cent of Year 6 pupils measured in Cambridge between April 2016 and March 2017 were obese and 2.8 per cent of them were severely obese. A further 13 per cent of primary school leavers were overweight.

This means that 32 per cent of Cambridge's young people are unhealthily overweight when they start secondary school.

Despite a focus on providing healthier school meals, the number of obese 10 and 11-year-olds in Year 6 has risen two per cent over five years. Caroline Corry, lead for the Obesity Health Alliance, a coalition of more than 40 organisations that have joined together to prevent obesity-related ill health, described the figures as "startling".

She said: "These latest figures show childhood obesity has risen over the last two years, with more children overweight or obese when they leave primary school than when they start."

The future of healthcare

Prof Mary Dixon-Woods writes for the Cambridge Independent

Exclusive | page 20

"We've seen a certain amount of progress from government, including the implementation of the soft drinks levy from April this year. But far more needs to be done."

The picture was better in South Cambridgeshire, where 24 per cent of youngsters were unhealthily overweight by the time they left primary school – below the national average.

The number of 10 and 11-year-olds who were declared obese in the district had also reduced from the previous financial year by 11 per cent.

Cambridgeshire County Council is supporting Public Health England's new Change4Life campaign, which has launched to help parents tackle their children's sugar intake.

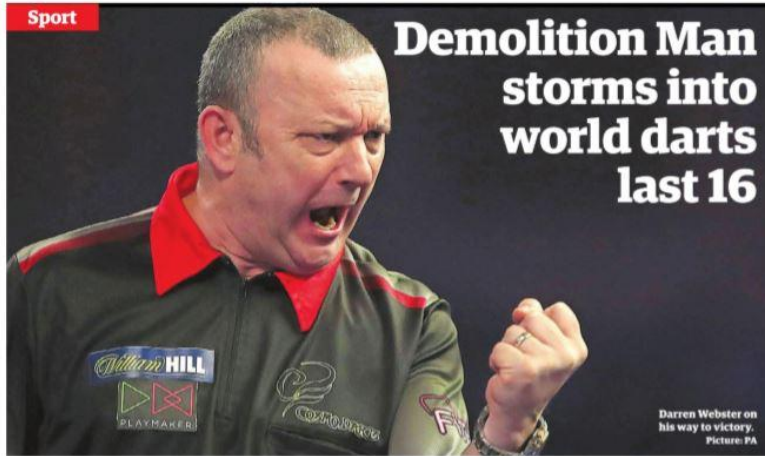

Val Thomas, consultant in public health at the council, said: "Eating and drinking too much sugar means extra calories, which cause fat to build up inside the body and can lead to heart disease, some cancers or type 2 diabetes later in life. Many of the unhealthy snacks children consume regularly are high in sugar and also typically high in calories, so making a few small changes can make a big difference to a child's health."

Rubbish! City's poor recycling is revealed

New figures show we are recycling less waste than five years ago

Less rubbish is being recycled from city homes, new figures have showed.

The fall has been described as "deeply concerning", with less than half - 38pc - of household waste in Norwich now being recycled, reused or composted.

LUKE POWELL
luke.powell@archant.co.uk

City Council said the drop in reported recycling rates for Norwich was due to a change in how it was calculated.

tonnes a year, equates to around 3pc of the waste we collect," the spokesman said. Norwich Green Party leader Martin Schmiever said he was confident more people were becoming aware of the importance of recycling.

But he said: "These figures

Daten sind die wichtigste Hürde

- Mehrzahl der Medien kauft Daten von externen Anbietern
- Lediglich Finanzdienste wie Reuters und Bloomberg sammeln selbst
- Rechtlicher Rahmen ist wichtig → Reporting-Standards wie XBRL

Die Zukunft gehört den automatisierten Texten

- Menschliche Reporter bleiben wichtig, besonders im Finanzjournalismus
- In Zukunft kommt aber immer mehr Content von Roboterjournalisten
- Automatisierung überall dort, wo es strukturierte Daten gibt
- Zugang zu Daten ist der Schlüssel
